Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/686,451

Applicant(s)

CAPECE ET AL.

Examiner

DUNG LAM

Art Unit

2617

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 13 April 2010.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-22 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-22 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO/SF/ICE)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

In view of the appeal brief filed on 4/13/10, PROSECUTION IS HEREBY REOPENED. A new ground of rejection is set forth below.

To avoid abandonment of the application, appellant must exercise one of the following two options:

(1) file a reply under 37 CFR 1.111 (if this Office action is non-final) or a reply under 37 CFR 1.113 (if this Office action is final); or,

(2) initiate a new appeal by filing a notice of appeal under 37 CFR 41.31 followed by an appeal brief under 37 CFR 41.37. The previously paid notice of appeal fee and appeal brief fee can be applied to the new appeal. If, however, the appeal fees set forth in 37 CFR 41.20 have been increased since they were previously paid, then appellant must pay the difference between the increased fees and the amount previously paid.

A Supervisory Patent Examiner (SPE) has approved of reopening prosecution by signing below:

/VINCENT P. HARPER/

Supervisory Patent Examiner, Art Unit 2617.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

1. Claims **1, 8 and 14, 21-22** rejected under 35 U.S.C. 103(a) as being unpatentable over **Jin** (US Pub. No. 2003/0012158) in view of **Ojaniemi** (WO 9705722) further in view of **Martin** (WO 03/067463A2).

2. Regarding claim **1**, **Jin** teaches a method of maintaining time information for a wireless communications base station, comprising:

selectively using time information from the a data set for conducting a communication involving the base station (The system selects another source of time information from another source when the GPS signal is loss; see Abstract, Fig. 6, [0036-0037, 0019, 0021, 0028]).

However, Jin does not specifically teach the data set is generated by a neural network.

In an analogous art, Ojaniemi teaches using time information provided to a source for generating a data set that provides time information (Abstract). Ojaniemi method of generating this data set of timing values/clock signal 212 by adaptively and repeatedly re-adjusting the clock signal until it matches with the first clock signal (C5 L29 to C6L8). This technique of repeatedly re-adjusting is very similar to that of a neural network by repeatedly adjusting its signal. Thus Ojaniemi provides a great suggestion to use one of the key feature of a neural network to repeatedly re-adjusting the signal until a primary signal matches with the secondary signal.

In an analogous art, **Martin** teaches a neural network receiving input past values of a numeric data time flow and outputs its predictive values for the numeric data time

flow (Abstract, See third to last page labeled "Page 1 or 2", Section <Desc/Cims Page Number1>; see also US equivalent US 2003/001258).

Jin contains a device which is different from the claimed process by the substitution of generating the dataset by *a neural network*. **Martin** teaches the substituted step of generating a data set of future values using a neural network and the function of the neural network were known in the art to predict/extrapolate future values more adaptively and accurately than other methods.

Jin's method of using the time information from a data set could have been substituted with the Martin's step of generating the time information and using a neural network (as suggested by **Ojaniemi**) and the results would have been predictable and resulted in a more accurate and adaptive extrapolation method. Therefore, the claimed subject matter would have been obvious to a person having ordinary skill in the art at the time of the invention was made.

3. Regarding claim **14**, **Jin** teaches a wireless communication device, comprising: a base station controller that determines time information from a global position system (GPS) source of time information and uses the data set for obtaining time information if the GPS source is unavailable to the base station controller. (The system selects another source of time information from another source when the GPS signal is loss. See Abstract, Fig. 6, [0036-0038, 0019, 0021, 0028]).

In an analogous art, **Ojaniemi** teaches using time information provided to a source for generating a data set that provides time information (Abstract). **Ojaniemi** method of generating this data set of timing values/clock signal 212 by adaptively and

repeatedly re-adjusting the clock signal until it matches with the first clock signal (C5 L29 to C6L8). This technique of repeatedly re-adjusting is very similar to that of a neural network by repeatedly adjusting its signal. Thus Ojaniemi provides a great suggestion to use one of the key feature of a neural network to repeatedly re-adjusting the signal until a primary signal matches with the secondary signal.

In an analogous art, **Martin** teaches a neural network receiving input past values of a numeric data time flow and outputs its predictive values for the numeric data time flow (Abstract, See third to last page labeled "Page 1 or 2", Section <Desc/Cims Page Number1>; see also US equivalent US 2003/001258).

Jin contains a device which is different from the claimed process by the substitution of generating the dataset by *a neural network*. **Martin** teaches the substituted step of generating a data set of future values using a neural network and the function of the neural network were known in the art to predict/extrapolate future values more adaptively and accurately than other methods.

Jin's method of generating the time information from a data set could have been substituted with the Martin's step of generating the time information and using a neural network (as suggested by **Ojaniemi**) and the results would have been predictable and resulted in a more accurate and adaptive extrapolated values. Therefore, the claimed subject matter would have been obvious to a person having ordinary skill in the art at the time of the invention was made.

Rearding claim **8**, the combination of **Jin, Ojaniemi and Martin** teach all the steps method of claim 1, including receiving time information from an external source (Jin [0036-0037]); determining when the external source time information is not available (Jin [0036-0038]); and using the data set for time information when the external source time information is not available (Abstract and <Desc/Cllms Page Number1> Martin).

Rearding claim **21 and 22**, the combination of **Jin, Ojaniemi and Martin** teach device of claim 14/1, wherein the data set corresponds to GPS time information (Ojaniemi, using second clock signal when primary signal is not available and secondary clock signal are adjust to match primary clock signal from GPS, p.5 L29 to C6L8, p.6 L17-28).

4. Claim **4-7, 9, 11-13, 17-20** rejected under 35 U.S.C. 103(a) as being unpatentable over **Jin, Ojaniemi and Martin** further in view of **Telia** (EP 631 453).
5. **Jin, Ojaniemi and Martin** teach all the steps of **claims 4 and 17**. Jin further teaches the step of gathering time information from an external source ([0036-0037]); however they do not explicitly teach the step of inputting the gathered time information to the neural network; and generating the data set based on the inputted time information. In an analogous art, **Telia** teaches the step of gathering data to be input to the neural network (C2 L2-25, C3 L46 – C4 L9) and generating data based on the input data (C3 L46 – C4 L9). Therefore, it would have been obvious for one of ordinary skill

in the art at the time of the invention to apply Telia's teaching of feeding data to the neural network prior to generating the data to John and Admitted PriorArt in order to comply with the way neural network typically operates.

6. **Jin, Martin and Telia** teach all the steps of **claim 5**, wherein Telia further teaches that the gathered time information extends over a selected period (C3 L9 - 18) and including comparing time information from the data set for a period corresponding to the selected period with the gathered time information; and changing at least one characteristic of the neural network when the data set time information does not correspond to the gathered time information within a selected range (C3 L46 - C4 L9, this section describes the well known learning process of the neural network).

7. **Jin, Martin and Telia** teach all the steps of **claim 6**, including changing the characteristic of the neural network by changing at least one of a number of layers in the neural network, a number of neurons in the neural network or a complexity factor of the neural network. It would have been obvious to one of ordinary skill in the art at the time the invention was made, to understand that for the neural network to learn, one of the above characteristics would have to be adjusted, as this is a known method of teaching/learning in a neural network.

8. **Jin, Martin and Telia** teach all the steps of **claim 7**, including repeatedly performing the steps of comparing and changing until the data set time information corresponds to the gathered time information within the selected range (Telia, C3 L46 - C4 L9).

9. **Jin** in view of **Martin** teach all the steps of **claim 9**, except for using an initialization time value and the data set to generate time information until the external source time information becomes available. In an analogous art, Telia teaches the concept of using the initialization time value and the data set till the external source available (C3 L46 - C4 L9). Therefore, it would have been obvious for one of ordinary skill in the art at the time of the invention to combine the above references' teaching with Telia's teaching because it enables the system to sustain its operation even though it loses its external source.

10. Jin, Ojaniemi and Martin teach all the steps of claim **11 and 18**, except for the data set comprises a plurality of coefficients for generating future time information based on upon a start time (weightings, column 3, line 56). In an analogous art, Telia teach the concept of using coefficients in neural networks. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made for generating future time information based upon a start time because the neural network has to begin its calculations at a starting point data set.

11. Jin, Ojaniemi and Martin teach in view of Telia teaches all the steps of **claims 12-13 and 19-20**, but not specifically providing at least more than 24 hours are two weeks of future time information using the data set. However, how long the data set should be is purely dependent on the applications and preferences. It would have been obvious to one of ordinary skill in the art at the time the invention was made, to understand that the choice of how long to provide timing information is one of design choice based on user requirements.

12. **Claim 2, 3 and 10, 15, 16** rejected under 35 U.S.C. 103(a) as being unpatentable over **Jin, Ojaniemi and Martin** (Applicant's admitted prior art) further in view of "Test Results and Analysis of a Low Cost Core GPS Receiver for Time Transfer Applications", IEEE International Frequency Control Symposium, J. Blake Bullock et al., pp. 314-322, (1997).

13. **Jin** in view of **Martin** teach all the limitation of **claims 2 and 15**, except wherein the data set is useful for a first time interval and including generating another data set for a second, later time interval. However, Bullock teaches that GPS receivers used for time synchronization, while very accurate, are known to lose their signals due to, for example, jamming as a result of RF interference. See pages 314-315 and 317. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made, to modify the method of Jin, Ojaniemi and Martin to include generating another data set for a later time interval as it is known that GPS signals may be lost as taught by Bullock (pages 314-315 and 317).

14. **Jin, Ojaniemi and Martin in view of Bullock** teach all the steps of **claims 3 and 16**, including repeatedly generating another data set for subsequent time intervals. See above.

15. **Jin, Ojaniemi and Martin** teach all the steps of **claim 10**, except for the external source time information comprises GPS time information. In an analogous art, **Bullock** teaches the use of GPS signals as the external source (pages 314-315 and 317). Therefore, it would have been obvious for one skill in the art at the time of the invention to combine Jin, Ojaniemi and Martin's teaching with Bullock's teaching of using GPS

Art Unit: 2617

signals as the external time source because this would result in a more accurate global time precision.

Response to Arguments

Applicant's arguments with respect to claim 1-22 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to DUNG LAM whose telephone number is (571) 272-6497. The examiner can normally be reached on M - F 9 - 5:30 pm, Every Other Friday Off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Paul Harper can be reached on (571) 272-7605. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

/VINCENT P. HARPER/

Supervisory Patent Examiner, Art Unit 2617
